Altitude Sickness Fact Sheet

At high elevation, you may experience a potentially life threatening condition called altitude sickness. This is exacerbated if you ascend in elevation quickly. At 8,000 feet, there is only ~75% of the available oxygen at sea level. Oxygen decreases ~3% with each 1000 feet in elevation. Altitude sickness is caused by the body not being able to get enough oxygen. There are three types of altitude sickness: Acute Mountain Sickness, High Altitude Pulmonary Edema, and High Altitude Cerebral Edema.

SYMPTOMS

Acute Mountain Sickness
• Lack of appetite, nausea, or vomiting
• Fatigue
• Dizziness
• Insomnia
• Shortness of breath upon exertion
• Nosebleed
• Persistent rapid pulse
• Swelling of hands, feet, and/or face

High Altitude Pulmonary Edema (HAPE)
• Symptoms similar to bronchitis
• Persistent dry cough
• Fever
• Shortness of breath even at rest

High Altitude Cerebral Edema (HACE)
• Headache that does not respond to medication
• Difficulty walking
• Altered mental state (confusion, changes in alertness, disorientation, irrational behavior)
• Loss of consciousness
• Increased nausea
• Blurred vision or retinal hemorrhage

PREVENTION

☐ If your hike starts at high elevation, spend a few days adjusting to the altitude prior to any major physical exertion.

☐ It is best to sleep no more than 1,500 feet (457.2 m) higher than you did the night before. This helps the body adjust gradually to the decreased amount of oxygen.

☐ Stay well hydrated. It is easier to dehydrate at altitude, and staying well hydrated can reduce headaches and other symptoms.

☐ Contact your primary care physician for an evaluation prior to traveling to areas with high elevation.
Altitude Sickness Fact Sheet

FIRST AID TREATMENT
- If you have any of these symptoms at altitude, assume that it is altitude sickness until proven otherwise. Do not ascend any further with symptoms.
- Acclimatization is possible for mild cases. However, if symptoms worsen, descent is the best option. Descend to the altitude where the victim last woke up symptom free.
- Keep the victim warm and hydrated.
- For HAPE and HACE descend immediately, even if at night, delay could be fatal.
- For HAPE and HACE seek medical attention immediately, even if symptoms subside upon descent.
